

**SYSTEM AND METHOD FOR EFFICIENT AND SECURE REVOCATION
OF A SIGNATURE CERTIFICATE IN A PUBLIC KEY INFRASTRUCTURE**

ABSTRACT

System and method for revocation of a signature certificate in a Public Key
5 Infrastructure (PKI) that includes an enterprise with one or more servers, a directory, a
registration web server, and one or more client platforms that allow users to access the
servers of the enterprise. A user may desire to revoke a potentially compromised
signature certificate of the user, or a manager of the user may revoke a signature
certificate because it has been lost by the user, or the manager no longer desires that
10 the user has access to servers of an enterprise. A user or personal revocation authority
(manager) initiates a revocation process by creating an authenticated secure channel
with a registration web server. Using the authenticated secure channel, the user or
personal revocation authority requests the registration web server revoke a user
signature certificate. The registration web server queries a directory to verify that the
15 personal revocation authority is permitted to revoke the signature certificate of the user.
The user signature certificate is revoked. The directory is notified by the registration
web server of revocation of the user signature certificate. A user entry in the directory
is set to a state without a signature certificate. A process for a new signature certificate
for the user may now occur.
